To Whom It May Concern,

This is a cover letter for the position of *Res Assoc Computer Science-Compilers*, Job ID: 727. My name is Dr. Rahulkumar Gayatri and I am currently based in Bangalore, India. I work as a technical specialist in the High Performance Computing group (HPC) at Wipro Infotech. I have been in this position since September 2015. I provide technical assistance to clients who wish to parallelize their application/algorithm. For this, I learn the theory and the science involved in the client's algorithm and apply my knowledge of parallel programming to develop parallel versions of the same.

Currently I am working on a project called Moose, <http://moose.ncbs.res.in>. It simulates the neural interactions in a human brain. The project is designed and implemented at the National Center for Biological Sciences, India (NCBS). The software uses a set of linear solvers such as Kinetic and Stochastic solvers to calculate the chemical and electrical behavior inside a cell. Due to the complexity of the problem, a cell is subdivided into multiple parts and different sub-cell parts are executed simultaneously using the shared memory parallelism. I implemented the Pthread and OpenMP parallelizations to simultaneously execute the various parts of the cell. The reason to implement two versions of the shared memory parallelism was to provide the students of NCBS a choice in case one preferred one programming model over the other. The efforts gave a performance boost of 5X on an 8-core machine. In the later stages of the project an MPI-based approach will be implemented, wherein different cells are distributed over the available nodes for simultaneous execution.

Previous to this, I was a Doctoral student at Barcelona Supercomputing Center (BSC), Barcelona, Spain. I graduated in March, 2015. My advisors were Rosa M.Badia and Eduard Ayguade. During this period, I was a part of the Programming Models group at the Barcelona Supercomputing Center (BSC). My Doctoral thesis was focused on speculative synchronization techniques for the StarSs framework, a task-based programming model.

I extended the StarSs framework to speculatively update shared memory locations using STM, instead of the traditional lock and mutex based mechanisms. Extension of the framework involved addition of new directives to the StarSs compiler (called mercurium) and providing the associated runtime support. The results achieved with this idea and implementation showed an increase in performance of applications which have high contention for locks.

An extension to speculative memory updates is the speculative execution of tasks, where tasks can be scheduled before their presence in the execution flow can be confirmed. I added additional directives to the StarSs framework, which, allowed tasks from multiple loop-iterations (while-loops in particular) to be executed simultaneously. I implemented a lightweight rollback mechanism which can be used to undo the updates of tasks in case the speculation fails. The idea of greedy task execution, wherein the tasks are

scheduled even before their validity can be ascertained improved the performance by an average of 20%.

At BSC, I also worked on porting applications using SMPs, StarSs implementation for SMPs onto Symmetric Multiprocessors (SMPs). I built applications such as NQueens, Specfem, Jacobi and Gauss-Seidel solvers, that show the performance benefits, ease of use and portability of using the StarSs framework. I also parallelized the Graph500 benchmark suite using SMPs. My background in mathematics helps me develop novel ideas for parallelization of algorithms and efficient ways to implement them. These applications are a part of the StarSs application repository.

In my Mtech thesis, I designed and implemented a Breadth First Search algorithm, that optimises the use of low memory available in the Synergistic Processing Element(SPE) of IBM's Cell.B.E processor. The strong point of the implementation was this design of the data structure to represent a node, which increased the memory locality.

My Doctorate work has also allowed me to work extensively on STM. I was actively involved and followed the development of the TinySTM library. Working in the programming models group at BSC and in the TERAFLUX project has taught me to effectively collaborate with other researchers to achieve the set goals. I have worked on compiler and runtime development of the StarSs programming model. My background in mathematics helps me in the development and implementation of parallel algorithms from different scientific domains. I am also experienced in the use of various tools to analyze the results obtained and optimize on the bottlenecks. I have experience in working with the widely used parallel programming models and work collaboratively within a team. Hence, I believe my skill set is an ideal match for the current job posting. This is my main motivation to apply for the current job.

The information regarding my publications is available in my resume. Please let me know if there are any other materials or information that will assist you in processing my application. Thank you for your consideration. I look forward to hearing from you.

Sincerely,

Rahul Kumar Gayatri
